Hotel Bookings

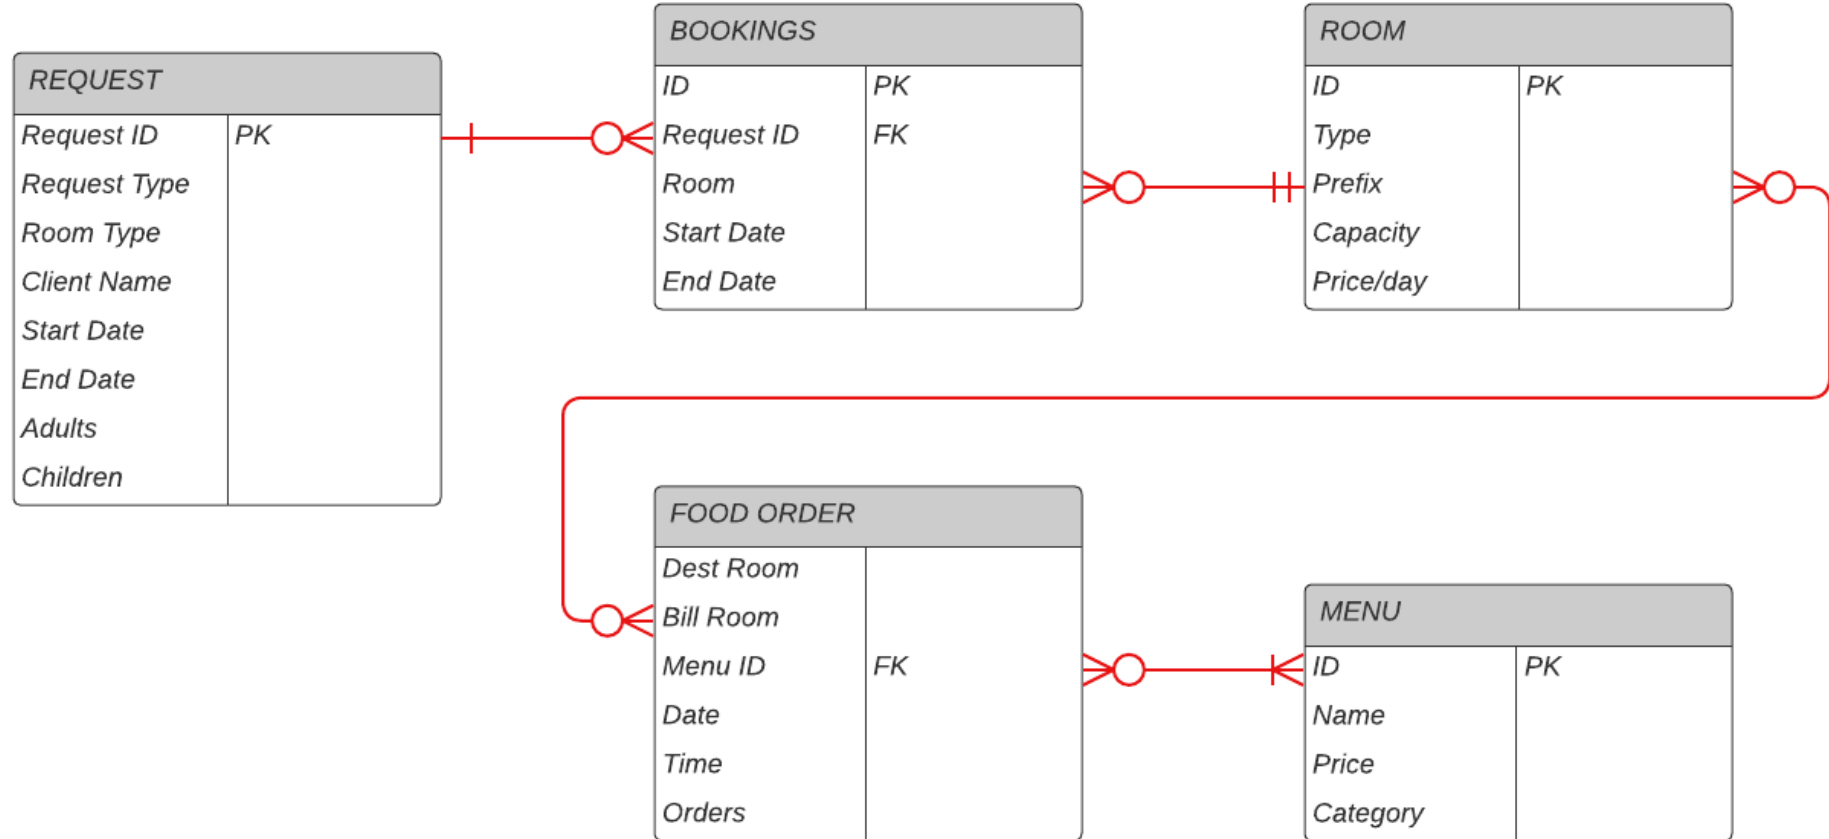

Hotel Case Study: Agenda

Entity Relationship Diagram (ERD)

ERD Description

- Request Table: Request table contains information about client requests, including the room type, number of occupants and request dates. The request ID serves as the unique identifier (PK) which is referenced in other tables. A one to many relationship exists between the Request and Booking tables

- Booking Table: This table contains information about booked rooms, the booked dates. It has a unique identifier - Booking ID - and references the Request ID as a foreign key. A many to one relationship exists between the Booking and Room tables

- Room Table: This table contains the capacity and pricing information of each room type and has a Room ID unique identifier (PK). A one to many relationship exists between the Room and Booking tables.

- Menu Table: This table lists the names and prices of each menu item uniquely identified with the Menu ID (PK). A many to many relationship exists between the Food Order and Menu tables

- Food Order: This table lists information about the date and time of food ordered and references the Menu ID as a foreign key

Hotel Bookings: Summary

- Data was imported and cleaned for analysis using SQL and visualized using Power BI
- Holiday had the highest amount of bookings with 3,441 bookings and generated the largest highest revenue of \$1.59M
- Normal rooms had the highest number of bookings with about 3.3k bookings and generated the highest hotel revenue of \$1.22M
- \$51,670 was lost due to 281 requests that didn't follow through.
- Normal rooms had the highest amount of lost hotel revenue - \$15,440 - due to failed requests
- Steak 'N' Stuff generated the highest food revenue and French breakfast was the most ordered at 600 orders
- Large conference rooms generated the highest food revenue and the ordered the most amount of food
- Dinners had the largest amount of orders monthly with about 2727 orders.

Data Quality: Issues

- Wrong Format: Inconsistent time format in Food Orders table i.e. 24hr format and 12hr format
- Wrong Values: Wrong year values were entered in booking start and end dates during data entry
- Redundant Values: the categorical data, vacation is a synonym for holiday in the request type column of the Request table
- Redundant Field: The "Room ID" primary key is not referenced in other tables.
- No "Food Order" table primary key
- Inconsistent attribute names in different tables

Data Quality: Recommendations

- Investment in database management systems like Azure or Oracle for easy data storage, manipulation and analysis
- Validation for request type, time and booking date columns should be established for accurate data entry
- Use of "Room ID" primary key in "Request" and "Food Order" tables to facilitate easy retrieval of room data
- Addition of "number of rooms" column in "Request" table to easily calculate capacity limits
- Creation of "Client" table to store client information, reward frequent customers, and for targeted ads.
- A separate column for title should be added to eliminate issues with searching client names.
